👉 GSV READ THE FILESYSTEM EVENTS CAREFULLY

Mozilla's 271 Bugs, Chrome's 4 Gigabytes, and a WebRTC Veteran Telling OpenAI to Stop

2026-05-08 📍 00:30:10

“A frontier-lab harness pointed at Firefox just turned a year of latent vulnerabilities into 271 fixes, and the team published exactly how they wired it.”

— LENAR KESS, TODAY'S NARRATION

[Show notes](#)[Transcript](#)

Mozilla publishes the long-form on how a Claude Mythos Preview harness found 271 security bugs in Firefox, including sandbox escapes that fuzzers missed for twenty years. A European privacy lawyer goes byte-precise on Chrome's silent four-gigabyte Gemini Nano push, using kernel filesystem events on a profile that received zero human input. A WebRTC veteran tells OpenAI, on the day it ships GPT-Realtime-2, that the protocol assumptions are wrong for voice agents. Plus AlphaEvolve's twelve concrete production deployments, Anthropic's natural-language autoencoders putting a number on Claude's evaluation awareness, AMD's first new Instinct PCIe card in five years, and OpenAI quietly winding down the fine-tuning API.
