The Ground Beneath AI Infrastructure

2026-10-24 / 00:11:35

“Sovereign software replacement is now technically feasible right as geopolitical risk rises. The real timeline question isn't if Europe will build alternatives, but how quickly US vendors can erode the trust they spent decades building.”

— Seln Oriax, today's narration

Three stories from Saturday, October 24th that ask what happens when AI infrastructure hits the ground.

Musk's Starshield decision makes European sovereignty real for US tech vendors. Google's Finland clearing shows physical infrastructure expanding faster than governance can check it. A paper about Z-Library uses AI to write about the sites publishers are suing — and produces hallucinated citations.

“An American company operating critical military infrastructure was able to degrade the capability of an American partner in the middle of a war. Without warning.”
